Findings

[CS-1] Reentrancy in withdraw allows fund theft

High

Description

The withdraw function in contracts/Lending.sol:88 calls an external token before updating internal accounting. An attacker can re-enter withdraw and drain the protocol.

Acceptance Criteria

The withdraw path must update internal balances strictly before performing any external token transfer. No re-entrant call may observe a stale balance.

Recommendation

Apply the checks-effects-interactions pattern: update internal balances before the external token call. Consider adding a reentrancy guard modifier for defence in depth.

Acknowledgement

Code Corrected

The team applied the recommended pattern in the follow-up commit.
