

1. Unsafe ERC20 transfer without return-value check

Severity: High

Description

The transfer call in target/contracts/Legacy.sol:L210 does not check the boolean return value. Some non-standard ERC20 tokens silently fail without reverting, leaving accounting desynced.

Recommendation

Use OpenZeppelin's SafeERC20 wrapper to enforce a revert on a false return value.

2. Missing zero-address check on owner setter

Severity: Low

Description

The setOwner function in target/contracts/Legacy.sol:L88 does not validate the new-owner argument against the zero address. Misconfiguration can permanently lock owner-gated functionality.

Recommendation

Add a require(newOwner != address(0)) check at the top of setOwner.
