

Sample Vault Security Review

Contents

5.Findings

5.1.Critical severity

5.1.1.withdrawFunds always uses target vault to withdraw instead to iterate 6

5.2.High severity

5.2.1.Excess ETH is not refunded on mint 10

5.Findings

5.1.Critical severity

5.1.1.withdrawFunds always uses target vault to withdraw instead to iterate

Severity: Critical Risk

Context: RouterVaults.sol#L88

Description: RouterVaults::withdrawFunds iterates over vaults in listVaults but unzap from the targetVault. This can revert when the target vault has insufficient reserves.

Recommendation: Extract vaults from vaultSplit and unzap from each vault in order.

Resolution: Fixed

5.2.High severity

5.2.1.Excess ETH is not refunded on mint

Severity: High Risk

Context: Crate721NTLC.sol#L120

Description: The mint path accepts msg.value above the required price and keeps the excess.

Recommendation: Refund msg.value - requiredPrice to msg.sender after minting.

Resolution: Acknowledged
